

NYQUIMOSS

ECOLOGICAL PANELS

PRODUCT CHARACTERISTICS

Architects are increasingly using natural and ecological materials in their projects, symbolizing a return to nature. Vertical gardens are the latest trend in interior design. Natural, specially prepared decorative moss is one of the most interesting proposals for the design of so-called "green walls".

NyquiMoss is a decorative moss made of a special type of ground moss - reindeer lichen from Norway. Thanks to the salinity process, moss retains its natural appearance and color that lasts for many years. It requires no maintenance, watering or access to light, so it can be used in darkened rooms. In addition to its great esthetics, it also has an extremely pleasant texture to the touch as it retains its natural softness and elasticity

Thanks to the use of a special acoustic foam underlay, NyquiMoss fulfils not only a decorative function, but also an acoustic one, with a high sound absorption coefficient. The moss modules make it possible to obtain any shape on the wall, to cut out logos or writings. Special dyes make NyquiMoss available in a wide range of colours - from vivid green to intense red or purple tones.

Acoustic moss allows you to have a lot of greenery without losing usable space. Walls made of this material create the effect of a living, three-dimensional wallpaper, which introduces a natural and warm atmosphere to any interior. NyquiMoss is perfect for all kinds of representative rooms, such as receptions, conference rooms, hotel lobbies, open spaces or modern public spaces.

NYQUIMOSS

ECOLOGICAL PANELS

PRODUCT PROPERTIES

	REACTION TO UV LIGHT	none
	NATURAL PRODUCT	yes
	WATERING NECESSITY	not required
	REQUIRED MOISTURE	30%
	ASSEMBLY	walls
	SURFACE STRUCTURE	soft
	DIMENSIONAL DEVIATIONS	+/- 5 mm
	ECOLOGICAL PRODUCT	yes

MATERIALS

NyqiMoss products are decorative panels with a high sound absorption coefficient of $aw \geq 0.90$ *. They are made of special acoustic foam with "open cell" structure. It is elastic, deformable and resistant to short-term surface pressure. The outer layer of NyquiMoss is decorative moss, made from ground lichen, dyed in one of several dozen available colors. It requires no watering, no pruning, and no additional maintenance. The top decorative layer retains its natural elasticity, will not crumble or break. It is suitable for indoor use where the humidity exceeds 30%. In case of lower humidity, a humidifier can be used.

OTHER

The dimensions of individual modules made of acoustic moss are adapted to the given order and the size of the adapted space. The panels can be mounted to the wall with glue or NYQUITAPE double-sided tapes. There is also a decorative version of Nyqimoss without acoustic foam underlay, which does not have absorbing properties. It is possible to order unusual shapes, logos or letters.
